CAMINETTI MAY FOR GOVERNOR

THE IMMIGRATION COMMISSION ER MAY RESIGN OFFICE TO RUN FOR GOVERNOR

SAN FRANCISCO, March 24.-United States Immigration Commissioner Anthony J. Caminetti is expected to resign office for the purpose of running for governor on the Democratic ticket. Caminetti has had the gubernatorial bee in his bonnet for some time but it has only made a noise like a buzz. Today he is willing to admit that he will be in on the him into the limelight of the commonwealth Lorin A. Handley, president of the Los Augeles board of publie works, as a running mate.

The story goes that Congressman John E. Raker, who has been men who explained that the Englishman tioned as a candidate on the Demo- had been executed by a firing squad cratic firing line, will not run for the after court martial. Friends of Benoffice. Raker, it is understood, has ton on the border charged that Villa determined to support Caminetti if himself had shot the ranchman with the commissioner determines to get a pistol, into the fight

man to Secretary of State William who is to be tried for the crime. handled the controversy with the de friends. gree of diplomacy that he finally displayed.

It is reported that Caminetti will hand in his resignation as immigration commissioner some time next month. The president, it is rumored, will give him administration support for the office so far as it is possible for him to do so with official dig- ing.

TWO-STAMP MILL **WILL BE ERECTED**

sked OWNERS OF DEATH VALLEY MINE ARRANGE FOR A SMALL PLANT

> Joseph B. Evans and local associates have arranged for the erection of a Tetrault two-stamp mill on their property, known as the Chucka walls mine, toward the southern end of the Funeral range of mountains in Death Valley. The mill will be purchased from the Tonopah manufacturers in the next few days and shipped to the mine by way of Shoshone on the line of the Tonopah and Tidewater railroad. Mr. Evans expects to have the plant running within the next 30 days, handling 10 tons

The Chuckawalla property has been developed by a tunnel on the vein a vertical depth of 400 feet. At though small, averaging about one foot in width, the vein yields assays of from \$50 to \$60 a ton, with additional small values in silver and lead. The property is made up of four claims, upon which there is ample water for milling purposes. Tribune.

TELEPHONE ACHIEVEMENTS

Telephone Service of Today the Creation of the Bell Company

In no line of human endeavor has the inventive brain of the scientist contributed more to the world's progress than by the creation of the art of telephony, of which the Bell system is the em-

When the telephone was born, nothing analogous to telephone service as we now know it existed. There was no tradition to guide, no experience to

The system, the apparatus, the methods-an entire new art had to be created. The art of electri-cal engineering did not exist. The Bell pioneers, recognizing that success depended upon the highest engineering and technical skill, at once organized an experimental and research department which is now directed by a staff of over 550 engineers and scientists, including former professors, post-gradustudents, scientific investigators—the graduates of over 70 universities,

From its foundation the company has continuously developed the art. New improvements in telephones, switchboards, lines, cables, have fol-lowed one another with remarkable rapidity.

While each successive type of apparatus to the superficial observer suggested similarity, each step in the evolution marked a decided improvement continuous, but is continuing. Substantially all of the plant now in use, including telephones, switch-boards, cables and wires, has been constructed, re-

newed or reconstructed in the past 10 years. Particularly in switchboards have the changes been so radical that installations costing in the aggregate millions have frequently been discarded

after only a few years of use.

Since 1877 there have been introduced 53 types and styles of receivers and 73 types and styles of transmitters. Of the 12,000,000 telephone receivers and transmitters owned by the Bell Company January 1, 1914, none were in use prior to 1903, while the average age is less than five years.

Within 10 years we have expended for construc-tion and reconstruction an amount more than equal to the present book value of our entire plant.

Long-distance and underground transmission was most formidable scientific problem confronting the relephone experts.

The retarding effect of the earth on the telephone current often impaired conversation through one mile underground as much as through 100 miles overhead. Overhead conversation had its distinct limitations

No possible improvement in the telephone transmitter could of itself solve these difficulties.

The solution was only found in the cumulative effect of improvements, great and small, in tele-phone, transmitter, line, cable, switchboard, and

every other piece of apparatus or plant required in the transmission of speech. While the limit of commercial overhead talking had increased from strictly local to over 1,000 miles as early as 1893, it was not until 1906 that conversation could be had over long-distance circuits of which as much as 20 miles was in underground cables. By 1906 underground talking distance had increased to 90 miles. By 1912 it was possible to talk underground from New York to Washington It was then that the construction of underground

conduits from Boston to Washington was deter-mined upon, not that it was expected to get a through underground talk between those places, but in case of storm or blizzard, to utilize intermediate sections in connection with the overhead. Our persistent study and incessant experimenta-tion have produced results more remarkable still. We have perfected cables, apparatus and methods that have overcome obstacles heretofore regarded

as insuperable both to long-distance overhead and underground conversation Underground conversation is now possible be tween Boston and Washington, four times the length of the longest European underground line. This cuabled the Bell System in the recent great storm, so destructive on land and sea, to maintain

communication for the public between all the principal points on the Atlantic seaboard. Telephone communication is established between New York and Denver, is potentially possible be tween all points in the United States, and by 1915 will be an accomplished fact between New York and San Francisco

In our use of methods or apparatus, we are committed to no one system. We own, control or have the right to use inventions necessary to operate any system recognized or accepted as the most efficient. The Bell System must always recognize, and in its selection must always be governed by the necessities of a national service, with its complex requirements, which is infinitely more exacting than local or limited service.

These achievements represent vast expenditures money and immense concentration of effort which have been justified by results of immeasurable benefit to the public. No local company unaided could bear the financial or scientific burden of this work. Such results are possible only through a centralized general staff, avoiding wasteful du-plication of effort, working out problems common to all for the benefit of all.

The pioneers of the Bell System recognized that telephone service as they saw it, was in the broad-est sense a public utility; that upon them rested a public obligation to give the best possible service at the most reasonable rates consistent with risk, investment and the continued improvement and maintenance of its property

Without this expenditure of millions and concentration of effort, the telephone art as it exists could not have been developed.

What we have done in working out these great problems in the past should be accepted as a guarantee of what we will do in the future.

THEO N VAIL President.
